Unified forecasting table preview

Table 1: Averaged forecasting results for the unified setting with $T = 1000$ under the expanding-window scheme. Results are averaged over the dependence-strength settings. Model orders are reported as (p, q). The smallest RMSE within each setting is highlighted in red, the smallest MAE in blue, and the smallest WIS in purple. WIS combines the 80% and 95% prediction intervals.

			RMSE			MAE			WIS
